*SIR is the ratio of reported hospital onset (HO) cases to the NHSN-predicted number of HO cases adjusted for the significant risk factors.

**Other than long-term acute care and rehabilitation acute care hospitals.

NA = Not Available

Notes: Incidence Rate per 10,000 patient days

*All hospitals reported 12 months of data except for hospitals with extreme outlier community-onset MRSA BSI prevalence rate(s).

[a] SIR is the ratio of reported hospital onset (HO) cases to the NHSN-predicted number of HO cases adjusted for the significant risk factors. An SIR is produced by NHSN when at least one infection is predicted. Hospitals with NHSN-predicted number of HO MRSA BSI cases <1 and reported number of cases <1 had no SIRs calcuated due to less precise comparisons.

[b] If the 95% Confidence Interval (CI) for the SIR includes 1, the number of reported cases is not statistically significantly different from that predicted.

[c] This column shows if the 95% CI indicates an infection count significantly higher (H), lower (L) or no different (N) than predicted.

† Hospitals reported infection data aggregated over all acute care campuses.

‡ Hospitals reported infection data separately by acute care campus.

[¶] Hospitals with data presented for only 9 months of the year in 2013; data from hospitals that reported extreme outlier community-onset MRSA BSI prevalence rate for certain quarters of the year were excluded from further analyses for those quarters

¥ Hospitals with NHSN-predicted number of HO MRSA BSI cases <1 and reported number of cases >0 had no SIRs calculated by NHSN due to less precise comparisons; however, we calculated the SIR, but this SIR and its comparison are not as reliable as SIRs based on a larger number of predicted infections. For a detailed explanation, please see the Technical Notes.
