**SIR is the ratio of reported hospital onset (HO) cases to the NHSN-predicted number of HO cases adjusted for the significant risk factors.

Notes: Rates are per 10,000 patient days.

N/A indicates 'not available' for that hospital type

[*]Table excludes LTAC and rehabilitation acute care hospitals.

¶ Hospitals with data presented for only 6 months of the year in 2014; data from hospitals that reported extreme outlier community-onset MRSA BSI prevalence rate for certain quarters of the year were excluded from further analyses for those quarters.

[a] SIR is the ratio of reported hospital onset cases to thepredicted number of cases adjusted for significant risk factors. An SIR is produced by NHSN when at least one infection is predicted, except for hospitals with extreme outlier community-onset MRSA BSI prevalence.

¥ SIR was calculated by CDPH if the predicted number of infections was less than 1, but the hospital reported 3 or more infections. This SIR and its comparison are not as accurate as SIRs based on a larger number of predicted infections. For a detailed explanation, please see the Technical Notes.

[b] If the 95% Confidence Interval (CI) for the SIR includes 1, the number of reported cases is not statistically significantly different from that predicted.

[c] This column shows if the 95% CI indicates an infection count significantly higher (H), lower (L) or no different (N) than predicted.

**Incidence rate for hospitals compared to pooled mean rate using 95% confidence intervals.

N=no difference, H=significantly higher, L=significantly lower than pooled mean rate.

Notes: Rates are per 10,000 patient days.

95% confidence intervals calculated based on exact Poisson distribution.

Case mix index was available and listed for most but not all hospitals. The State of California Pooled Data case mix index is the mean of all case mix indices.
