EXECUTIVE SUMMARY

(Note: All reference to years is based on federal fiscal year [FFY] October 1 - September 30.)

The Office of Refugee Health (ORH) Data Report is prepared annually to provide an overview of the most recent data on demographic characteristics and health conditions data among the refugee population in California. In FFY 2017, the number of arriving refugees decreased slightly when compared to the previous year. However, data continues to show significant health screening results in regards to infectious diseases, chronic disease indicators and health risk factors.

The intended purpose of this report is to inform state and local refugee stakeholders in planning and assessment of policy development relating to refugee resettlement and resource allocation. Furthermore, the data analyzed over time, geography and demographic characteristics will allow ORH and other state and local public health programs to better assess the health disparities among this population. As the largest recipient state of arriving refugees in the nation, continued monitoring and surveillance is essential to promote long-term success and a healthy quality of life.

BACKGROUND

The Refugee Act of 1980 was passed by Congress in order to standardize resettlement services for all refugees admitted to the U.S. The Act also provides the legal basis for The Office of Refugee Resettlement (ORR) to provide federal funding and services to refugees at state and local levels. With funding from ORR, the California Department of Public Health (CDPH), ORH was established in 1981 to provide statewide leadership in refugee health and to coordinate refugee health services in California. The framework for CDPH/ORH is built upon leading state and national recommendations for refugee health that includes the provision of comprehensive health assessments, culturally and linguistically competent services, health education and promotion activities, and data collection and surveillance.

Under the Refugee Health Assessment Program (RHAP), the CDPH/ORH allocates federal Refugee Medical Assistance funds from the ORR to refugee impacted local health jurisdictions (LHJs) statewide. As shown on the map on page 5, the LHJs are categorized by funded vs fee-for-service. LHJs plan and coordinate with public and private health providers, mental health providers, social services agencies, community-based organizations, voluntary agencies, etc., to enhance access to health care for refugees. The health and demographic information collected by LHJs provides early diagnosis, intervention, referral and health education for chronic and communicable diseases, intervention for immunizations for children and adults, continuity of care through medical record transfer, and statewide standardization of services provided.

DATA SUMMARY

For the past 4 years, approximately 70,000-85,000 refugees resettle in the United States annually with the state of California receiving 15% to 17% refugees. However, executive orders enacted in 2017 reduced refugee admissions from 110,000 to 50,000. The actual number of arrivals into the U.S. were 53,716 (U.S. Department of State, Bureau of Population, Refugees and Migration). With the refugee ceiling admissions for the FFY18 lowered to 45,000, the expected number of arrivals will continue to decrease throughout the U.S.

Data collected by LHJs are entered into Refugee Health Information System (RHEIS)* and undergo quality control measures for analysis. Methods of analysis include descriptive, trend, and ratios. The report includes demographic data for FFY 2004-2017, with significant health screening data for FFY 2017. The number of arrivals represent completed health assessments conducted at the LHJs.

During the period of 2004 through 2017 [Table 7-Appendix], California received over 127,000 refugees from 161 different countries, speaking more than 144 different languages. In FFY 2017, California received 72% of refugees who originated from the following top three countries: Afghanistan (52%), Iran (12%), and Iraq (8%). The number of arrivals into California slightly decreased by 5.3% from 2016 [See Figure 3 from Appendix]. A total of 11,563 arrivals from 81 countries [Table 7-Appendix] underwent a health assessment within 90 days of arrival. The distribution of arrivals across the LHJs is as follows: Sacramento (44.5%), San Diego (16.4%), Los Angeles (16.4%), Stanislaus (6.4%), Alameda (4.8%), Orange (3.6%), Contra Costa (3.0%), San Francisco (2.2%), and Santa Clara (1.5%) (Figure 1 and Table 6-Appendix). In the past 3 years, the county distribution has remained relatively the same with the exception of Sacramento, which has increased by 52%. As shown in Figure 2, the median age at arrival was 27 and the gender distribution was 47% female and 53% male. Of the varying age groups, regardless of sex, the largest group of arrivals (27%) were 30-50 years old.

In order to maintain consistency with Center for Disease Control and Prevention (CDC) medical guidelines, RHEIS collects health screening information that aims to improve the health of the refugee population. These are based on principles of best practices and include screenings for clinical conditions that are suggestive of underlying disorders. Since refugees come from diverse regions of the world that are predisposed to health risks and diseases, domestic screening and evaluation is important for newly arrived refugees. Based on International Classification of Diagnoses (ICDs) for 2014, of the total top ten diagnosis cases (5,711), dental caries were the highest reported diagnosis among arrivals at 18.6% [Table 1].

The screening tests in Table 2 were selected as conditions commonly detected among refugees upon arrival. The screening guideline* outlines individuals who are required to obtain the screening tests according to age, sex, and country of origin. Of the 11,563 screened cases, the following reported tests were required for all refugees arriving into California: Hepatitis B surface antigen (HbsAg), Strongyloides, HIV, and glucose. 1.2%

tested positive for HbsAg, 2.3% positive for Strongyloides, 0.1% positive for HIV, and 12.5% (random) and 11.5% (fasting) had elevated glucose levels.

Of arrivals with an African country of origin, 423 of the 457 refugees were screened for Schistosomiasis. 28.3% of the valid data (excludes not applicable) tested positive. For those with missing screening results, presumptive treatment were completed in the predeparture country.

Individuals within a specific age group were screened for the following tests: syphilis, chlamydia, pregnancy, lipid panel, and lead*. In recent years, refugee children in the U.S. have shown increased average rates of blood lead level (BLL) of 5 mcg/dl or above. Thus, we focused our evaluation on refugee children (0-16 years of age). Among the 4,703 cases screened for lead levels, 27.7% reported elevated lead levels.

In general, optimal lipid levels help maintain a healthy heart and lower the risk of heart attack or stroke. Thus, the results of the lipid panel plus other risk factors will help determine a person's overall risk of coronary heart disease. Of those screened (2,135), 51.3% had low levels of high-density lipoprotein (HDL) cholesterol, 45.6% elevated levels of total cholesterol, 51.9% elevated levels of triglycerides, and 36.9% elevated levels of low-density lipoprotein (LDL) cholesterol. These are based on the reference ranges according to the recommendations of the National Cholesterol Education Program (NCEP)*.

With the continuing rise of refugee women arriving in the U.S., the need to address the reproductive health outcomes of this population is essential. In total, 4.8% tested positive for being pregnant at the time of the assessment. Of the reported infectious diseases, 1.3% tested positive for chlamydia while 0.6% tested positive for syphilis.

According to the ova and parasite test results [Table 3], the highest reportable parasite was Blastocystis Hominis (40.1%). Detected parasites were identified from either of the two stool samples collected at the time of the assessment. Parasites on the list were considered pathogenic or nonpathogenic according to the CDC Intestinal Parasite Guideline.

In regards to tuberculosis disposition [Table 4], 9% arrivals were classified as latent tuberculosis infection (TB II and TB IV) while 90.7% had no TB exposure. Of the total arrivals (18 years and older) with reported blood pressure (5,830), 12% were at risk for hypertensive, while 38.9% were defined as prehypertensive [Table 5]. Individuals with significant health screening findings received further treatment as needed from their primary care physician.

^{*} See General Notes for more information on screening guideline and limitations to the data

Refugee Health Information System Overview

The data represented in this report are gathered and transmitted by RHAP grantees into an online electronic database known as Refugee Health Information System (RHEIS). RHEIS serves as the tool that allows CDPH/ORH to improve and standardize the collection of quality, comprehensive data and to enhance processes for program planning and policy decisions and program management and oversight. RHEIS data also provides RHAP grantees data and reports to guide local planning efforts, ensure program performance and support local funding requests.

Limitations of Data

ORH emphasizes the importance of collecting and maintaining valid and quality data. It is important to highlight potential limitations in existing data and interpretations to ensure the information is used appropriately. The following data limitations should be considered while viewing this report:

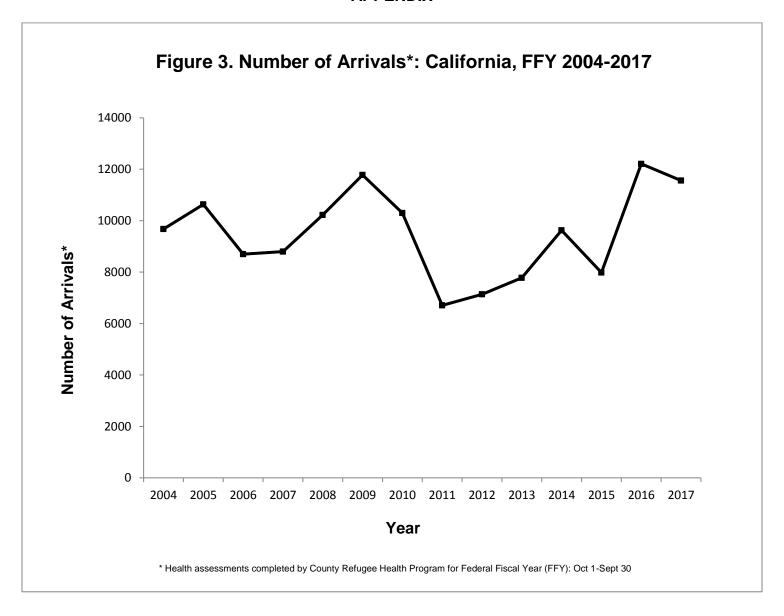

- The number of arrivals represents individuals, unless stated as cases. These eligible arrivals are screened by the LHJs under ORH program guidelines.
- Missing and/or unknown values are a result of incomplete assessments.
 Reasons may include (but not limited to): moved out of state, unable to locate, declined, used other provider or did not keep appointment.
- Some screening tests are age-specific, sex-specific, and country-specific.
 Recommendations may need to be altered based on the patient history, unanticipated/unrecognized health conditions, clinical judgment, cultural knowledge or family/social/medical history.
- Timeliness of data collection and data entry into RHEIS may vary depending on the lag time of each LHJs.
- ORH makes health screening recommendations based on CDC guideline updates.

Despite limitations, demographic and health screening data provides an important means to monitor and evaluate health status for the refugee population. The data can facilitate development of policies, improve clinical practice, inform others about the health status of the California refugee population and assist in resource allocations at the local and state levels to reduce disparities and prioritize health equity.

ACKNOWLEDGEMENTS

The success of the California Department of Public Health, Office of Refugee Health is largely attributable to the strength of its collaborative relationships with key partners at the federal, state, local, and community levels. Thus, the Office of Refugee Health would like to thank the Refugee Health Programs from the local health jurisdictions for their dedication and hard work. They not only provide the necessary medical screening but also the data for this publication. Lastly, the Office of Refugee Health would like to thank our funding agencies, the Office of Refugee Resettlement and the Centers for Disease Control and Prevention.
