^a The number of completed pregnancies include those that ended in a live birth, miscarriage, stillbirth, or termination.

^b Birth defects reported include those that have been detected in infants infected with Zika before, during, or shortly after birth, including microcephaly, calcium deposits in the brain indicating possible brain damage, excess fluid in the brain cavities and surrounding the brain, absent or poorly formed brain structures, abnormal eye development, or other problems resulting from damage to the brain that affects nerves, muscles and bones, such as clubfoot or inflexible joints, and confirmed hearing loss.

^c Includes miscarriage, stillbirths, and terminations with evidence of the birth defects mentioned above

Note: Although the above outcomes occurred in pregnancies with laboratory evidence of possible Zika virus infection, we do not know whether they were caused by Zika virus infection or other factors. There are ongoing efforts to better understand Zika virus infection and pregnancy outcomes.

^d Total number includes laboratory-confirmed and probable infections as defined by the [CSTE Position Statement](#).

^e Includes one non-resident
