## 9<sup>th</sup> Annual EOH Technical Symposium

### “Energy Alternatives for California's Future: Environmental and Occupational Health Aspects”

**March 5, 2014 California State University, Northridge**

Rising energy costs and increased awareness among the public are finally starting to force global leaders to research alternatives, and provide funding, to develop renewable energy production. Issues like global warming are becoming mainstream reality and causing world-wide concerns about pollution and consumption. In this symposium, we will consider not only the need for change, but also the environmental and occupational health challenges that will accompany large-scale changes to various forms of renewable energy production. Our proposed program includes the topics of climate change, renewable energy regulations and policies, sustainability considerations, fossil fuels, solar and wind generation, and toxins associated with energy production and utilization.

Program and registration details will be available early January 2014

Our program will offer 8 hours of Continuing Education Credits for CIH, CSP, REHS, and other organizations
