Violent Deaths Involving Multiple Victims in California, 2017-2018

Vital statistics data are collected from death certificates for all violent deaths that occur in California. Enhanced surveillance through CalVDRS is completed for a subset of participating counties by linking vital statics data to supplemental data abstracted from coroner and medical examiner reports, toxicology reports, and law enforcement reports. Circumstances that contributed to the death that were documented in these reports were abstracted from this supplemental data and included in the surveillance system. This additional data can address the who, where, when and how of the deaths to help us try to understand why they occurred.

Violent death events involving more than one victim are linked into a single incident in CalVDRS. In order to be considered a single incident, the two (or more) related deaths must result from injuries occurring within 24 hours of each other. This linkage allows for the ability to gain greater insight into incidents involving more than one related death. These multiple victim incidents (e.g., multiple homicides, homicide(s) followed by suicide, multiple suicides) are of particular concern due, in part, to the emotional and economic impact multiple deaths can have on families and communities. Identifying common factors involved in these particularly violent incidents can provide opportunities for prevention of such incidents in the future. This document summarizes selected demographic and circumstance data for participating CalVDRS counties.

Multiple Victim Incidents in California, 2017-2018

From 2017-2018, there were 13,547 violent deaths reported across California with the majority being single suicide and single homicide. Among CalVDRS participating counties, 322 violent deaths were identified as being involved in a multiple victim incident (102 deaths in 2017 among three counties and 220 deaths in 2018 among 21 counties). These 322 deaths were the result of 145 incidents. The majority of incidents involved two deaths, with six deaths being the maximum number abstracted in a single incident. Of these incidents involving multiple deaths, most were characterized as deaths in a multiple homicide (47%) and single homicide followed by suicide (34%).

ABOUT CalVDRS

The California Violent Death Reporting System (CalVDRS) is housed in the Injury and Violence Prevention Branch in the California Department of Public Health. CalVDRS is funded by the Centers for Disease Control and Prevention to conduct statewide surveillance on violent deaths that occur in California. Violent deaths include homicide (including legal intervention deaths that result from law enforcement acting in the line of duty), suicide, unintentional firearm deaths, and deaths of undetermined intent that meet the CalVDRS definition. CalVDRS collects data from multiple sources (i.e., death certificates, medical examiner/coroner reports, and law enforcement reports) in order to gain a more comprehensive understanding of the circumstances surrounding these deaths. The goal of this system is to promote development of data-driven public health prevention strategies that aim to reduce the number of violent deaths that occur each year.

Among All Multiple Victim Violent Deaths Incidents (n=322)

- **Female**, 34%
- **Male**, 66%

- **85%** involved firearms
- **25%** of deaths were gang related
- **22%** involved more than two deaths
- **22%** of victims were also a homicide suspect in the incident
- **42%** of homicide suspects attempted/completed suicide
- **15%** of victims were perpetrators of interpersonal violence in the previous month (includes homicide of partner or previous partner followed by suicide)
Definitions
This document further defines and describes two distinct groupings of multiple victim incidents:

Multiple Homicide Incidents (n=160) – Includes: Multiple homicide (n=150), Multiple legal intervention (n=4), Multiple homicide followed by legal intervention (n=4), and Mutual homicide (n=2)

Homicide(s) followed by Suicide Incidents (n=155) – Includes: Single homicide followed by suicide (n=110), and Multiple homicide followed by suicide (n=45)

Characteristics of Homicide(s) Followed by Suicide
Most homicides followed by suicides involve interpersonal violence and/or the suspect is known and close to the victim. The suicide victim is also the suspect in the incident.

- 75.9% of homicide victims were female while 88.2% of suspects/suicide victims were male
- 70.1% of homicide victims experienced intimate partner violence
- 80.1% of homicide suspects/suicide victims were either an intimate partner, ex intimate partner, or family member of the homicide victim
- 29.0% of homicide suspect/suicide victims were a current spouse or intimate partner of the homicide victim

Characteristics of Multiple Homicides
About half of multiple homicides were gang-related and the relationship between victim and suspect was unknown or missing.

- 80.6% of multiple homicide victims were male and 61.3% of the suspects were male
- 67.5% of multiple homicide victims were reported as having an unknown type of relationship with the suspect or the information was missing
- 8.8% of multiple homicide victims experienced intimate partner violence
- 48.8% of incidents were gang-related
- 9.4% of multiple homicide victims used a weapon in the incident
Opportunities for Prevention of Multiple Victim Incidents

- **Focus on Firearms:** The fatal weapon for most victims (85%) of multiple victim incidents across incident types was a firearm. Strategies to facilitate safe firearm storage or those that may limit access to firearms may help to prevent these deaths in the future.

- **Focus on Risk Factors:** It may be beneficial to address risk factors that are relevant to the different types of incidents so that prevention efforts can be focused on individuals and groups who are most at risk of violent death. For example:
  - **Intimate Partner Violence (IPV):** Implement strategies to prevent IPV and increase awareness for the need to promote healthy relationships. Increase awareness of and access to resources for victims of IPV.
  - **Gang-Related Violence:** Often associated with at-risk youth and younger victims, prevention strategies should identify various points of intervention in the life course of youth and young adults at risk of exposure to gang-related violence.

**Notes:**

2017-2018 CalVDRS County Participation

CalVDRS data collection began in 2017 with three pilot counties (Los Angeles, Shasta, and Siskiyou) and expanded to include 21 counties in 2018 (Amador, Butte, Fresno, Humboldt, Imperial, Kern, Kings, Lake, Los Angeles, Marin, Placer, Riverside, Sacramento, San Benito, San Diego, San Francisco, San Mateo, Shasta, Siskiyou, Ventura, and Yolo). CalVDRS is supported by a grant funded by the Centers for Disease Control and Prevention (CDC), National Center for Injury Prevention and Control (Grant 5 NU17CE924854).
