California Workers Get Asthma From Their Jobs

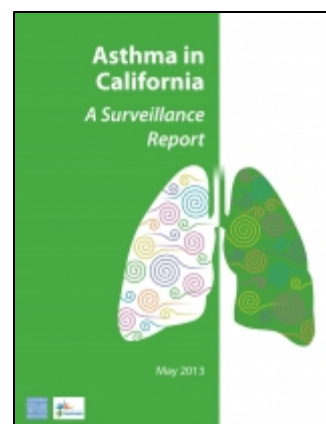

Roughly 40% of California's adults with asthma, or an estimated 974,000 people, have asthma that has been caused or aggravated by their work. Nearly two-thirds of these workers did not have asthma until it was caused by conditions or substances at a job.

This is a key finding from a new asthma tracking report that includes a [chapter](#) devoted to work-related asthma.

The California Department of Public Health has just released, "[Asthma in California: A Surveillance Report](#)."

The Occupational Health Branch's [Work-Related Asthma Prevention Program \(WRAPP\)](#) analyzed data from a statewide survey conducted between 2006 and 2009 to estimate the extent of work-related asthma among Californians for the report.

The survey also showed that only 28% of people with work-related asthma reported having discussed work exposures with their doctor, illustrating that work-related asthma is often not recognized or diagnosed.

The impacts of work-related asthma are serious. Symptom frequency, asthma attacks, and limitation of activities were significantly more common among adults with work-related asthma compared to adults with asthma that is not work-related.
