*Table excludes long-term acute care hospitals, free standing rehabilitation acute care hospitals, and rehabilitation units within a general acute care hospitals.

¶ Hospitals with data presented for only 9 months of the year in 2015; data from hospitals that reported extreme outlier community-onset MRSA BSI prevalence rate for certain quarters of the year were

¶ SIR was calculated by CDPH if the predicted number of infections was less than 1 but greater than or equal to 0.2. This SIR and its comparison are not as accurate as SIRs based on a larger number of a SIR is the ratio of reported hospital onset cases to the predicted number of cases adjusted for significant risk factors. An SIR is produced by NHSN when at least one infection is predicted, except for hospitals b If the 95% Confidence Interval (CI) for the SIR includes 1, the number of reported cases is not statistically significantly different from that predicted.

c This column shows if the 95% CI indicates an infection count significantly higher, lower, or no different than the baseline SIR of 1.00.
