Central Line Associated Bloodstream Infection Surveillance

Last updated 2019

Basics of Infection Prevention
Healthcare-Associated Infections Program
Center for Health Care Quality
California Department of Public Health
Objectives

• Review CLABSI surveillance definitions
• Discuss importance of accurate data collection
• Demonstrate how to report CLABSI events summary data in NHSN
• Discuss NHSN data analysis and feedback to staff
CLABSI Surveillance for Prevention

1. Perform surveillance for CLABSI using NHSN standardized definitions and methods
2. Compare SIR or rate over time to assess prevention progress
3. Monitor CLABSI incidence over time using the standardized infection ratio (SIR) metric

(See Introduction to NHSN slides)
CLABSI Surveillance Key Terms

• Lab confirmed bloodstream infection (LCBI)
  • Blood culture positive for a pathogen

• Commensal
  • Organism not usually considered pathogenic
  • Include (but not limited to)
    • Diphtheroids
    • Propionibacterium spp.
    • coagulase-negative staphylococci
    • viridans group streptococci
    • Aerococcus spp.
    • Micrococcus spp.

See NHSN Patient Safety Manual: Chapter 4, pp 4-10, NHSN organism list
https://www.cdc.gov/nhsn/pdfs/pscmanual/4psc_clabscurrent.pdf
CLABSI Surveillance

• For BSI to be considered a CLABSI, a **central line** must be

  • In place for >2 days on the date of the event (date device placed = day one)

  AND

  • **Still in place** on day of event -or- in place **on the day prior** to the event

• The CLABSI **event date** is defined as the day the **first** element used to meet the surveillance definition occurs within the seven-day window period
CLABSI Surveillance Definition

**LCBI 1**
Patient of any age
- has a recognized pathogen cultured from one or more blood cultures and
- Organism cultured from blood is not related to an infection at another site

**LCBI 2***
Patient of any age
- has common skin commensals cultured from 2 or more blood cultures drawn on separate occasions and
- has at least one of the following signs or symptoms
  - Fever (>38°C), chills, or hypotension
  - Signs and symptoms and (+) lab results are not related to an infection at another site

**LCBI 3***
Patient of ≤ 1 year of age
- has common skin commensals cultured from 2 or more blood cultures drawn on separate occasions and
- has at least one of the following signs or symptoms
  - Fever (>38°C), hypothermia (<36°C core), apera, or bradycardia and
  - Signs and symptoms and (+) lab results are not related to an infection at another site

*All criteria occur within 7 day infection window period
Mucosal Barrier Injury (MCBI) BSI

- More specific BSI definition for oncology patients
- BSI resulting when intestinal organisms from compromised intestinal wall mix into the bloodstream
- Occurs in post allogeneic hematopoietic transplant or severely neutropenic patients
- MCBI SIR is calculated separately from CLABSI SIR
CLABSI Infection Criteria- Acute Care Hospitals

Diagnostic Test for Possible CLABSI

- Positive blood culture with a pathogen OR-
- 2 positive blood cultures with common commensals

Localized Sign or Symptoms for Possible CLABSI (ONLY used with 2 blood commensals)

- Fever
- Chills
- Hypotension

NHSN Patient Safety Module: Chapter 4
CLABSI due to Common Commensal Organisms

- Two blood cultures have been collected on the same or consecutive days
  - One positive culture may be due to poor skin prep prior to lab draw (skin contaminant)
  - Two matching positive cultures of the same commensal, meeting criteria, are considered a true pathogen

Example: Blood cultures positive for common commensal organism (e.g., S. epi) collected on Mon-Tues meets LCBI 2; cultures collected on Mon-Wed are too far apart
CLABSI Infection Window Period

• Defined as the 7-days during which all site-specific infection criteria must be met

• Includes the day the **first** positive blood culture was obtained, 3 calendar days before and 3 calendar days after

<table>
<thead>
<tr>
<th>Infection Window Period:</th>
<th>3 days before first positive diagnostic test</th>
<th>FIRST POSITIVE DIAGNOSTIC TEST</th>
<th>3 days after first positive diagnostic test</th>
</tr>
</thead>
</table>

NHSN Patient Safety Module: Chapter 4
CLABSI Event Date

- The date of event is the date the first element is used to meet the definition for the first time.
- May or may not be the positive blood culture date.
CLABSI Location Attribution

• A CLABSI is attributed to the location of the patient on the day of event
  • Defined as the date that the first element used to meet the LCBI criterion occurred
• If the date of event for a CLABSI is the day of transfer or discharge, or the next day, the infection is attributed to the transferring location
• Attribute CLABSI to correct location for accurate SIR calculations. Each location has different risk adjustments in NHSN

NHSN Patient Safety Module: Chapter 4
CLABSIs Cannot Re-Occur in the Same Patient within a 14-Day Timeframe

• The date of the CLABSIs event is considered day 1
• A new CLABSIs is not reported until 14 days have elapsed
• If a new pathogen is identified in the blood within the 14 day timeframe, it should be added to the CLABSIs already reported
  • Refer to the CLABSIs protocol for more details
Secondary BSI Attribution

• The period in which a positive blood culture must be collected to be considered a secondary BSI to a primary site of infection
  • Includes the 7-day infection window combined with the 14-day repeat infection timeframe, or 14-17 days depending on the date of the event
  • A positive blood culture collected outside this 14-17 date range cannot be considered a secondary BSI to the primary infection
• A primary BSI (CLABSI) cannot have a secondary BSI

NHSN Patient Safety Module: Chapter 4
Secondary BSI Attribution -2

• A secondary BSI may be attributed to a primary site of infection if one of the following is true:
  1. The blood culture pathogen matches an organism also cultured in the primary infection site
  OR
  2. A positive blood culture is an element used to meet the primary site infection

• See the Secondary BSI Guide (Table B1) of the CLABSI protocol for more details

NHSN Patient Safety Module: Chapter 4
Secondary BSI Attribution -3

- NHSN Infections that include a positive blood culture as an element in the primary site definition:
  - Bone-Osteomyelitis
  - Burn
  - Disc space infection
  - Endocarditis
  - GI tract infection
  - Intra-abdominal infection
  - Joint
  - Meningitis
  - Other infection-reproductive tract
  - Pneumonia
  - Spinal abscess
  - Omphalitis
  - Urinary System Infection

NHSN Patient Safety Module: Chapter 4, Secondary BSI Guide, pp 4-27, Table B1
Pathogen Assignment

• If a new blood pathogen is identified within the 14-day repeat infection timeframe, it should be added to the already reported CLABSI as an additional pathogen
• Do not report it as a new CLABSI
• Pathogens excluded from specific infection definitions (e.g. yeast for UTI and PNEU) are also excluded from being considered secondary bloodstream infections
  • Example: Yeast in the blood and urine would be reported as a CLABSI, as yeast is excluded from the UTI definition
• Refer to the NHSN protocol for more details on pathogen assignment and secondary BSI

NHSN Patient Safety Module: Chapter 4
Pathogens Associated with CLABSI

- Coagulase-negative Staphylococci 16%
- *Staphylococcus aureus* 13%
- *Klebsiella (pneumoniae/oxytoca)* 8%
- *Enterococcus faecalis* 8%
- *Enterococcus faecium* 7%
- *Candida albicans* 6%
- *Escherichia coli* 5%
- Candida spp 5%

NHSN Antimicrobial Resistance Report: Distribution of all Pathogens Reported by HAI Type, Appendix to Table 4, 2011-2014

How do I Apply the CLABSI Surveillance Definitions?

Let’s look at some...
**NHSN HAI and POA Worksheet Generator**

Based on the information you provided:
- **Admit Date:** Tue, Jan 01 2019
- **The event is:** HAI
- **Date of Event:** Fri, Jan 04 2019
- **Infection Window Period:** Tue, Jan 01 2019 - Mon, Jan 07 2019
- **Repeat Infection Timeframe (RIT):** Fri, Jan 04 2019 - Thu, Jan 17 2019
- **Event Type:** BSI

Admit date: 1/1/2019

<table>

</table>

**UTI & Secondary BSI**
- **DOE**: 1/3/19
- **Pathogen**: E. faecalis

**Primary BSI**
- **DOE**: 1/11/19
- **Pathogen**: Yeast
Add Monthly CLABSI Summary Data to NHSN

- Enter monthly denominator data for each patient location
  - Patient days
  - Central line days
Optional: Denominator Data Sampling

**How to sample:** Count the number of the location patient days and the number of central lines on a designated day each week. Not on Saturday or Sunday. Add those numbers for the month and enter here.

1. Enter Monthly patient days for this location based on daily collection

2. Check Box if sampling is used

3. Enter sampled total patient-days

4. Enter sampled total central line days

5. NHSN will estimate the central line days for the month

**Note:** Sampling may not be used for NICU or specialty care areas/oncology
Add CLABSI Event to NHSN

- Add CLABSI Events as they occur
- Collect criteria data meeting definition to enter into NHSN
- NHSN has a worksheet available for data collection

https://www.cdc.gov/nhsn/forms/57.108_Primariesi_BLANK.pdf
NHSN CLABSI Analysis Reports

- Add CLABSI Events as they occur
- Collect criteria data meeting definition to enter into NHSN
- NHSN has a worksheet available for data collection
  
  https://www.cdc.gov/nhsn/forms/57.108_PrimaryBSI_BLANK.pdf
**NHSN TAP Report - CLABSI**

- Identifies the **number of infections that needed to be prevented** to reach targeted goal (CAD)
  - Lists results high-to-low by location
  - Assists in deciding where to focus infection prevention resources
Measure CLABSI Prevention Progress

• Feedback results to your staff and leadership
• Changes in CLABSI incidence should be visible over time
• In the example, we can see ONC needed additional interventions
CLABSI Surveillance Summary

• Consistent use of standard surveillance methods and CLABSI definitions are essential for accurate case finding

• Capturing complete and accurate data is necessary for precise CLABSI SIR calculation

• Perform surveillance and feedback CLABSI SIR with adherence monitoring results to all units and leadership
