Preventing Urinary Tract Infections in Skilled Nursing Facilities
Objectives

• Describe of healthcare-associated urinary tract infections (UTI) in skilled nursing facilities (SNF)
• Review evidence-based clinical practices shown to prevent catheter-associated urinary tract infections (CAUTI)
• Discuss strategies to reduce CAUTI
• Discuss adherence monitoring and feedback
UTI in Skilled Nursing Facilities (SNF)

- UTI is the most common HAI in SNF
  - Accounts for 20% of infections
- Bacteriuria very common (but not an infection)

SHEA/APIC Guideline: Infection Prevention and Control in Long-Term Care, 2008
What is Bacteriuria?

- Bacteria can be present in the bladder, not causing infection
  - Example: E. coli contamination from the rectal area
  - No symptoms of infection
- Bacteriuria alone does not affect survival and does not require antibiotics!
- Risk of bacteriuria with catheterization
  - 3%-10% each day
  - By day 30, 100% residents with a urinary catheter will have bacteria in urine

SHEA/APIC Guideline: Infection Prevention and Control in Long-Term Care, 2008
UTI Risk Factors

- Age related changes to genitourinary tract
- Neurogenic bladder
- Diabetes
- Instrumentation required to manage bladder voiding
- Indwelling urethral catheter
- Straight catheterization

NHSN Long-term Care Facility Component
Urinary Tract Infection Updated January, 2018
Urinary Catheters in SNF

• 7-10% of SNF residents have an indwelling urinary catheter

• Catheterization predisposes resident to catheter-associated UTI (CAUTI)

• Catheterized urinary tract most common source of bacteremia, a blood infection that may lead to sepsis
CAUTI Etiology

- Pathogen source
  - Patient’s GI or perineal bacteria
  - Bacteria on hands of healthcare personnel (HCP)
- Microbes enter bladder via one of two routes
  - On the external surface of the catheter
  - On the inside of the catheter

Common UTI Pathogens

- *Escherichia coli* 24%
- *Pseudomonas aeruginosa* 10%
- *Klebsiella pneumoniae/oxytoca* 10%
- *Enterococcus faecalis* 7%

NHSN Antimicrobial Resistance Report: Distribution of all Pathogens Reported by HAI Type, Appendix to Table 4, 2011-2014

CAUTI Complications

• Cystitis
• Pyelonephritis
• Bacteremia
• Septic shock
• May result in
  • Functional decline
  • Decreased mobility
  • Hospital admission
  • Death

NHSN Long-term Care Facility Component
Urinary Tract Infection Updated January, 2018
Preventing CAUTI

• **69% CAUTI can be prevented with currently recommended infection prevention practices**
  • 380,000 infections prevented annually – 40,000 in California
  • 9,000 lives saved - ~1,000 in California

CAUTI Prevention Care Practices

**CDC**
- Insert catheters only for appropriate indications
- Leave in place only as long as needed
- Ensure only properly trained persons insert and maintain
- Perform hand hygiene
- Use aseptic technique and sterile equipment for insertion
- Maintain closed drainage system and unobstructed urine flow
- Use portable ultrasound devices to assess urinary retention, reduce unnecessary catheterizations (Category II)
- Implement improvement program to achieve appropriate use of catheters

CAUTI Prevention Care Practices - continued

**APIC/SHEA**
- Use smallest diameter catheter as possible
- Irrigate only if catheter is obstructed
- Keep collecting bag below the bladder
- Ensure adequate nutrition and hydration
- Consider alternatives to indwelling urinary catheters
  - External catheters
  - Intermittent catheterization

SHEA/APIC Guideline:
Infection Prevention and Control in Long-Term Care, 2008
Appropriate Indications for Urinary Catheters

- Acute urinary retention or obstruction
- Prolonged immobilization due to unstable spine or pelvic fracture
- Assist healing of perineal and sacral wounds in incontinent patients
- Hospice (end of life), comfort care, palliative care
- Chronic indwelling urinary catheter on admission
  - Necessity must still be evaluated on admission

## CAUTI Prevention Bundle Examples

<table>
<thead>
<tr>
<th>Insertion Bundle</th>
<th>Maintenance Bundle</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify need prior to insertion</td>
<td>Daily assessment of catheter need documented</td>
</tr>
<tr>
<td>Insert urinary catheter using aseptic technique.</td>
<td>Tamper evident seal is intact</td>
</tr>
<tr>
<td>Maintain urinary catheter based on recommended guidelines.</td>
<td>Catheter secured to patient</td>
</tr>
<tr>
<td></td>
<td>Hand hygiene performed before patient contact</td>
</tr>
<tr>
<td></td>
<td>Daily meatal hygiene with soap and water</td>
</tr>
<tr>
<td></td>
<td>Drainage bag emptied using a clean container</td>
</tr>
<tr>
<td></td>
<td>Unobstructed flow maintained</td>
</tr>
</tbody>
</table>

APIC Preventing CAUTI, Patient-centered Approach, 2012:

Not Recommended

No evidence that these practices prevent UTI
X Complex urinary drainage systems
X Routinely changing catheters or drainage bags
X Routine antimicrobial prophylaxis
X Cleaning the periurethral area with antiseptics
X Antimicrobial irrigation of the bladder
X Antiseptic / antimicrobial solutions instilled into drainage bags
X Routine screening or culturing

CDC CAUTI Prevention guidelines, 2009:
Facility Role in CAUTI Prevention

- Ensure policies and practice reflect current evidence based recommendations
  - HICPAC/CDC 2009 guidelines
- Ensure staff competency upon hire and at least annually
  - New hire orientation
  - Annual skills fair
  - Return demonstration to ensure competency
- Establish an adherence monitoring program for core care practices
  - Use standard tools to measure adherence
- Perform UTI surveillance
- Provide feedback to frontline staff and leaders
  - Present adherence results with UTI/CAUTI incidence
Adherence (Process) Measures

Measure catheter use:

• Days with Foley catheter ÷ Patient days (x 100) = ___%

Measure health care provider adherence:

• Hand hygiene
• Documentation of catheter insertion and removal
• Daily assessment of indwelling urinary catheter
• Documentation of indications for use
## Indwelling Urinary Catheter Adherence

<table>
<thead>
<tr>
<th>Urinary Catheter Care Practices</th>
<th>Indwelling Urinary Catheter Patient/Resident</th>
<th>Indwelling Urinary Catheter Patient/Resident</th>
<th>Adherence by Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>The indwelling urinary catheter is being used for an appropriate indication</td>
<td>□ Yes</td>
<td>□ No</td>
<td></td>
</tr>
<tr>
<td>Necessity for continuing the indwelling urinary catheter is documented in the medical record</td>
<td>□ Yes</td>
<td>□ No</td>
<td></td>
</tr>
<tr>
<td>The seal between the catheter and collecting tubing is intact</td>
<td>□ Yes</td>
<td>□ No</td>
<td></td>
</tr>
<tr>
<td>The catheter tubing is unobstructed and not twisted, kinked, or looped</td>
<td>□ Yes</td>
<td>□ No</td>
<td></td>
</tr>
<tr>
<td>The urine collection bag is below the level of the bladder.</td>
<td>□ Yes</td>
<td>□ No</td>
<td></td>
</tr>
<tr>
<td>The catheter is secured to the patient/resident.</td>
<td>□ Yes</td>
<td>□ No</td>
<td></td>
</tr>
</tbody>
</table>

#Yes ___  Total # Observations____  Total #Yes / Total # observations *100 =  % _________Adherence

Adherence Monitoring Tools (www.cdph.ca.gov/hai)
CDPH CAUTI Observations, 131 Facilities, 2016

- Seal intact: 39%
- Tubing unobstructed: 60%
- Necessity documented: 95%
- Urine collection bag below bladder: 98%
- Cath secured to resident: 62%
Infection (Outcome) Measure

Measure infections:

- Perform UTI surveillance using standardized definitions and protocols
- Bacteria in urine alone is not an infection
  - Must evaluate for other UTI symptoms or have supporting laboratory data

NHSN Patient Safety Module: Chapter 7 Device-Associated Module, CAUTI
UTI Incidence Over Time (Sample Graph)

Are CAUTI Prevention Core Care Practices Used Routinely in Your Facility?

- Insert catheters only for appropriate indications
- Leave in place only as long as needed
- Ensure only properly trained persons insert and maintain
- Perform hand hygiene
- Use aseptic technique and sterile equipment for insertion
- Maintain closed drainage system and unobstructed urine flow
- Implement improvement program to achieve appropriate use of catheters

You won’t know if you don’t monitor!
Summary

• CAUTI can lead to bloodstream infections
• Adherence monitoring to evidence based care practices will reduce CAUTI incidence
• Feedback CAUTI incidence and adherence monitoring results to staff will improve outcomes
