Preventing Urinary Tract Infections in Skilled Nursing Facilities

Last updated 2018
Objectives

• Describe healthcare-associated urinary tract infections (UTI) in skilled nursing facilities (SNF)
• Review evidence-based clinical practices shown to prevent catheter-associated urinary tract infections (CAUTI)
• Discuss strategies to reduce CAUTI
• Discuss adherence monitoring and feedback
UTI in Skilled Nursing Facilities (SNF)

- The most common HAI in SNF is UTI
  - Accounts for 20% of infections
- Bacteriuria also common

SHEA/APIC Guideline: Infection Prevention and Control in Long-Term Care, 2008
What is Bacteriuria?

• Bacteria can be present in the bladder, not causing infection
  • Example: E. coli contamination from the rectal area
  • No symptoms of infection
• Bacteriuria alone does not affect survival and does not require antibiotics!
• Risk of bacteriuria with catheterization
  • 3%-10% each day
  • By day 30, 100% residents with a urinary catheter will have bacteria in urine

SHEA/APIC Guideline: Infection Prevention and Control in Long-Term Care, 2008
UTI Risk Factors

- Age related changes to genitourinary tract
- Neurogenic bladder
- Diabetes
- Instrumentation required to manage bladder voiding
- Indwelling urethral catheter
- Straight catheterization

Source: CDC
Urinary Catheters SNF

• 7-10% of SNF residents have an indwelling urinary catheter
• Catheterization predisposes resident to catheter-associated UTI (CAUTI)
• Catheterized urinary tract most common source of bacteremia, a blood infection that may lead to sepsis
CAUTI Etiology

- Pathogen source
  - Patient’s GI or perineal bacteria
  - Bacteria on hands of healthcare personnel (HCP)
- Microbes enter bladder via one of two routes
  - On the external surface of the catheter
  - On the inside of the catheter

Common UTI Pathogens

- *Escherichia coli* 24%
- *Pseudomonas aeruginosa* 10%
- *Klebsiella pneumoniae/oxytoca* 10%
- *Enterococcus faecalis* 7%

NHSN Antimicrobial Resistance Report: Distribution of all Pathogens Reported by HAI Type, Appendix to Table 4, 2011-2014

CAUTI Complications

• Cystitis
• Pyelonephritis
• Bacteremia
• Septic shock
• May result in
  • Functional decline
  • Decreased mobility
  • Hospital admission
  • Death

NHSN Long-term Care Facility Component
Urinary Tract Infection Updated January, 2018
Preventing CAUTI

- **69% CAUTI** can be prevented with currently recommended infection prevention practices
  - 380,000 infections prevented annually – 40,000 in California
  - 9,000 lives saved - ~1,000 in California

CAUTI Prevention Care Practices

CDC

- Insert catheters only for appropriate indications
- Leave in place only as long as needed
- Ensure only properly trained persons insert and maintain
- Perform hand hygiene
- Use aseptic technique and sterile equipment for insertion
- Maintain closed drainage system and unobstructed urine flow
- Use portable ultrasound devices to assess urinary retention, reduce unnecessary catheterizations (Category II)
- Implement improvement program to achieve appropriate use of catheters

Additional CAUTI Prevention Care Practices

**APIC/SHEA**

- Use smallest diameter catheter as possible
- Irrigate only if catheter is obstructed
- Keep collecting bag below the bladder
- Ensure adequate nutrition and hydration
- Consider alternatives to indwelling urinary catheters
  - External catheters
  - Intermittent catheterization

*SHEA/APIC Guideline: Infection Prevention and Control in Long-Term Care, 2008*
Appropriate Indications for Urinary Catheters

- Acute urinary retention or obstruction
- Prolonged immobilization due to unstable spine or pelvic fracture
- Assist healing of perineal and sacral wounds in incontinent patients
- Hospice (end of life), comfort care, palliative care
- Chronic indwelling urinary catheter on admission
  - Necessity must still be evaluated on admission

CDC CAUTI Prevention guidelines, 2009:  
## CAUTI Prevention Bundle Examples

<table>
<thead>
<tr>
<th>Insertion Bundle</th>
<th>Maintenance Bundle</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Verify need prior to insertion</td>
<td>• Daily assessment of catheter need documented</td>
</tr>
<tr>
<td>• Insert urinary catheter using aseptic technique.</td>
<td>• Tamper evident seal is intact</td>
</tr>
<tr>
<td>• Maintain urinary catheter based on recommended guidelines</td>
<td>• Catheter secured to patient</td>
</tr>
<tr>
<td></td>
<td>• Hand hygiene performed before patient contact</td>
</tr>
<tr>
<td></td>
<td>• Daily meatal hygiene with soap and water</td>
</tr>
<tr>
<td></td>
<td>• Drainage bag emptied using a clean container</td>
</tr>
<tr>
<td></td>
<td>• Unobstructed flow maintained</td>
</tr>
</tbody>
</table>

UTI Prevention in SNF

• Do not routinely perform urinalysis or culture to screen for bacteriuria

• Policies for catheter use should address
  • Catheter insertion
  • Closed drainage systems
  • Maintenance of urinary flow
  • Indications for changing the catheter

• Develop policies and procedures for aseptic connections, cleaning, and storage of leg bags

• Ensure and maintain adequate hydration

SHEA/APIC Guideline: Infection Prevention and Control in Long-Term Care, 2008
Not Recommended

No evidence that these practices prevent UTI

X Complex urinary drainage systems
X Routinely changing catheters or drainage bags
X Routine antimicrobial prophylaxis
X Cleaning the periurethral area with antiseptics
X Antimicrobial irrigation of the bladder
X Antiseptic / antimicrobial solutions instilled into drainage bags
X Routine screening

CDC CAUTI Prevention guidelines, 2009:
UTI Prevention Process Measures

Measure health care provider adherence:

• Documentation of indications for use
• Hand hygiene
• Daily assessment of indwelling urinary catheter

# Indwelling Urinary Catheter Adherence Monitoring Tool

#Yes ___  Total # Observations ___  Total #Yes / Total # observations *100 =  % ________Adherence

Adherence Monitoring Tools: cdph.ca.gov/hai
UTI Prevention Outcome Measure

Measure infections
- UTI incidence
- CAUTI incidence
UTI Incidence Over Time (Sample Graph)

SNF UTI Incidence 2018

Implemented UTI Prevention Team

UTI Incidence

Jan | Feb | Mar | Apr | May
--- | --- | --- | --- | ---
0   | 3   | 4.5 | 3.5 | 0.5

UTI per 1000 Resident Days
Facility Role in CAUTI Prevention

- Ensure policies and practice reflect current evidence based recommendations
  - HICPAC/CDC 2009 guidelines
- Ensure staff competency upon hire and at least annually
  - New hire orientation
  - Annual skills fair
  - Return demonstration to ensure competency
- Establish an adherence monitoring program for core care practices
  - Use standard tools to measure adherence
- Perform UTI surveillance
- Provide feedback to frontline staff and leaders
  - Present adherence results with UTI/CAUTI incidence
CDPH CAUTI Observations, 131 Facilities, 2016

- Seal intact: 39%
- Tubing unobstructed: 60%
- Necessity documented: 95%
- Urine collection bag below bladder: 98%
- Cath secured to resident: 62%
HEALTHCARE-ASSOCIATED INFECTIONS PROGRAM

Are CAUTI Prevention Core Care Practices Used Routinely in Your Facility?

- Insert catheters only for appropriate indications
- Leave in place only as long as needed
- Ensure only properly trained persons insert and maintain
- Perform hand hygiene
- Use aseptic technique and sterile equipment for insertion
- Maintain closed drainage system and unobstructed urine flow
- Implement improvement program to achieve appropriate use of catheters

You won’t know if you don’t monitor!

UTI Prevention Practices in LTC

- Use clean technique for residents with impaired bladder emptying managed with intermittent catheterization
  - Policies for catheter use should address
    - Catheter insertion
    - Closed drainage systems
    - Maintenance of urinary flow
    - Indications for changing the catheter
- Develop policies and procedures for aseptic connections, cleaning, and storage of leg bags
- Ensure and maintain adequate hydration

SHEA/APIC Guideline: Infection Prevention and Control in Long-Term Care, 2008
UTI Prevention Practices in SNF

• Do not routinely perform urinalysis or culture to screen for bacteriuria
