Note: This report includes data from many different sources of influenza surveillance, including syndromic surveillance, laboratory surveillance, and mandatory reporting of influenza deaths for cases ages 0-64 years. The information contained in this report should be viewed as a “snapshot” of influenza activity for each surveillance week, and should not be considered as population-based data or representative of all California public health jurisdictions.

Based on low levels of influenza-like illness and laboratory detections, overall influenza activity in California during Week 48 was “sporadic*.”

Influenza Report Highlights

- Outpatient influenza-like illness (ILI) decreased 0.8% in Week 48 (0.7%) compared to Week 47 (1.5%).
- Of 1000 specimens tested during Week 48,
  - 22 (2.2%) were positive for influenza; of these
    - 3 (13.6%) were influenza B and
    - 19 (86.4%) were influenza A.
    - 9 (47.4%) were subtyped as seasonal A (H3)
    - 1 (5.3%) was subtyped as 2009 A (H1N1) and
    - 9 (47.4%) were not subtyped.
- The California Department of Public Health Viral and Rickettsial Disease Laboratory (CDPH-VRDL) has not tested any specimens for antiviral resistance to date.
- No California specimens have been strain-typed by the Centers for Disease Control and Prevention (CDC) to date.
- CDPH has received one report of an influenza-associated death in a person less than 65 years of age.
- No cases of novel influenza have been detected in California.

*For the Centers for Disease Control and Prevention (CDC) definitions of influenza geographic distribution, please go to the [CDC Influenza page](http://www.cdc.gov/flu/weekly/overview.htm).

A. Syndromic Surveillance Update

1. CDC Influenza Sentinel Providers

A total of 77 enrolled sentinel providers have reported data for Week 48, compared to an average of 113 providers reporting for each of the previous weeks. Based on available data, the percentage of ILI visits for Week 48 (0.7%) was below baseline (Figure 1).
2. Kaiser Permanente Hospitalization Data

The percentage of hospitalizations for pneumonia and influenza (P&I) in Kaiser Permanente facilities in northern California was below baseline during Week 48 (Figure 2). During Week 48, 4.5% of hospitalizations were due to P&I, compared to 4.5% of hospitalizations in the previous week.
Figure 2. Percentage of P&I Hospitalizations in Kaiser Permanente Northern California Hospitals, 2008–2012

The percentage of influenza detections in the RLN and sentinel laboratories remained low in Week 48 (2.2%) (Figure 3). In Week 48, of 1000 specimens tested by the RLN and sentinel laboratories, 3 (0.3%) were positive for influenza B and 19 (1.9%) were positive for influenza A. Of the 19 specimens that tested positive for influenza A, 9 (47.4%) were subtyped as seasonal A (H3), 1 (5.3%) was subtyped as 2009 A (H1N1), and 9 (47.4%) had no further subtyping performed. The influenza-positive specimens were reported from Alameda, Fresno, Los Angeles, Monterey, Orange, Sacramento, San Diego, San Francisco, San Mateo, and Santa Clara counties.

To date for the 2012–2013 season, of 5996 specimens tested, 99 (1.7%) were positive for influenza; of these, 22 (22.2%) were influenza B and 77 (77.8%) were influenza A. Of the 77 specimens that tested positive for influenza A, 34 (44.2%) were subtyped as seasonal A (H3), 1 (1.3%) was subtyped as 2009 A (H1N1), and 42 (54.5%) had no further subtyping performed.

Neither the RLN nor CDPH-VRDL have identified any influenza viruses by polymerase chain reaction (PCR) typing or subtyping that are suggestive of a novel influenza virus.

B. Laboratory Update

1. Respiratory Laboratory Network (RLN) and Sentinel Laboratory Surveillance Results

The percentage of influenza detections in the RLN and sentinel laboratories remained low in Week 48 (2.2%) (Figure 3). In Week 48, of 1000 specimens tested by the RLN and sentinel laboratories, 3 (0.3%) were positive for influenza B and 19 (1.9%) were positive for influenza A. Of the 19 specimens that tested positive for influenza A, 9 (47.4%) were subtyped as seasonal A (H3), 1 (5.3%) was subtyped as 2009 A (H1N1), and 9 (47.4%) had no further subtyping performed. The influenza-positive specimens were reported from Alameda, Fresno, Los Angeles, Monterey, Orange, Sacramento, San Diego, San Francisco, San Mateo, and Santa Clara counties.

To date for the 2012–2013 season, of 5996 specimens tested, 99 (1.7%) were positive for influenza; of these, 22 (22.2%) were influenza B and 77 (77.8%) were influenza A. Of the 77 specimens that tested positive for influenza A, 34 (44.2%) were subtyped as seasonal A (H3), 1 (1.3%) was subtyped as 2009 A (H1N1), and 42 (54.5%) had no further subtyping performed.

Neither the RLN nor CDPH-VRDL have identified any influenza viruses by polymerase chain reaction (PCR) typing or subtyping that are suggestive of a novel influenza virus.
The proportion of respiratory syncytial virus (RSV) detections increased in Week 48 (12.6%, compared to 9.1% in Week 47) (Figure 4).

2. Antiviral Resistance Testing

CDPH-VRDL has not tested any influenza specimens for antiviral resistance to date during the 2012–2013 influenza season.

3. Influenza Virus Strain Characterization
No California specimens have been strain-typed to date during the 2012–2013 influenza season.

C. Laboratory-confirmed Fatal Case Reports

Currently, as mandated under Section 2500 of the California Code of Regulations, deaths among cases age 0-64 years with laboratory-confirmed influenza are reportable to CDPH.

In Week 48, CDPH received the first report of an influenza-associated death for the 2012-2013 influenza season. The case-patient was an adult between the ages of 40-49 years from central California who had multiple co-morbid conditions considered by the Advisory Committee on Immunization Practices (ACIP) as risk factors for severe influenza. The patient tested positive for influenza A by rapid test.

D. Influenza-associated Outbreaks

CDPH has received no reports of laboratory-confirmed influenza outbreaks during the 2012–2013 influenza season.

For questions regarding influenza surveillance and reporting in California, please email InfluenzaSurveillance@cdph.ca.gov. This account is monitored daily by several epidemiologists.

For more information regarding the different influenza surveillance data sources, please visit the CDPH Influenza Surveillance Program at https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/Immunization/Flu-Reports.aspx

To obtain additional information regarding influenza, please visit the CDPH influenza website at https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/Immunization/Influenza.aspx.

A copy of the case report form for reporting any laboratory-confirmed influenza case that was either admitted to the ICU or died can be downloaded from the Severe Influenza Case History Form Link at https://www.cdph.ca.gov/CDPH%20Document%20Library/ControlledForms/cdph9070.pdf.
