California Influenza and Other Respiratory Disease Surveillance for Week 2

(January 10, 2016 to January 16, 2016)

Note: This report includes data from many sources of influenza surveillance and it should be viewed as a preliminary “snapshot” of influenza activity for each surveillance week. Because data are preliminary, the information may be updated in later reports as additional data are received. These data should not be considered population-based or representative of all California public health jurisdictions.

Overall influenza activity in California remained at “regional*” during Week 2.

Influenza Report Highlights

- Influenza activity in California remains elevated based on increased laboratory detections of influenza virus.
- Outpatient influenza-like illness (ILI)
  - 1.2% of patient visits during Week 2 were for ILI, which is lower compared to Week 1 (1.3%); the percentage of visits for ILI is below expected levels for this time of year
- Hospitalization data
  - 5.0% of Kaiser patients hospitalized during Week 2 were admitted with a pneumonia and/or influenza (P&I) diagnosis, which is lower compared to Week 1 (6.8%); the percentage of P&I admissions is within expected levels for this time of year
- Influenza virus detections by Respiratory Laboratory Network and Sentinel Laboratories
  - 414 (8.4%) of 4,952 specimens tested were positive for influenza during Week 2, which is lower compared to Week 1 (10%)
- Influenza-associated deaths among patients 0–64 years of age
  - There was 1 laboratory-confirmed influenza death reported during Week 2
- Influenza-associated outbreaks
  - There were 2 laboratory-confirmed influenza outbreaks reported during Week 2

*Regional: Outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.
A. Outpatient and Inpatient Data

1. Influenza Sentinel Providers

Sentinel providers (physicians, nurse practitioners, and physician assistants) situated throughout California report on a weekly basis the number of patients seen with influenza-like illness (ILI) and the total number of patients seen for any reason. ILI is defined as any illness with fever (≥100°F or 37.8°C) AND cough and/or sore throat (in the absence of a known cause other than influenza).

A total of 74 enrolled sentinel providers have reported data for Week 2. Based on available data, the percentage of visits for ILI in Week 2 (1.2%) was below expected baseline levels for this time of year (Figure 1). Please note that an influential sentinel provider has not yet reported for Weeks 1 or 2; the percentage of visits for ILI for Weeks 1 and 2 are expected to increase once these reports are received.

Figure 1. Percentage of Influenza-like Illness Visits Among Patients Seen by California Sentinel Providers, 2011-2016

[Graph showing percentage of influenza-like illness visits]

2. Kaiser Permanente Hospitalization Data

Inpatients at Kaiser Permanente facilities with an admission diagnosis including the keywords “flu,” “influenza,” “pneumonia,” or variants of the keywords are defined as pneumonia and influenza (P&I)-related admissions. The number of P&I admissions is divided by the total number of hospital admissions occurring in the same time period to estimate the percentage of P&I admissions. Admissions for pregnancy, labor and delivery, birth, and outpatient procedures are excluded from the denominator.

The percentage of hospitalizations for pneumonia and influenza (P&I) in Kaiser Permanente facilities in northern California during Week 2 was 5.0% compared to Week 1 (6.8%) and is within expected baseline levels for this time of the year (Figure 2).
3. Influenza-Associated Hospitalizations, California Emerging Infections Program

The California Emerging Infections Program (CEIP), Influenza Surveillance Network (FluSurv-NET) conducts population-based surveillance for laboratory-confirmed influenza-associated hospitalizations among patients of all ages in Alameda, Contra Costa, and San Francisco counties.

The incidence of influenza-associated hospitalizations per 100,000 population in Week 1 (0.37) is higher compared to Week 52 (0.25) (Figure 3). Data for Week 2 are not presented because results are still being collected and are likely to change.

Figure 3. Incidence of Influenza Hospitalizations in CEIP Counties, 2013–2016
B. Laboratory Update - Influenza

1. Respiratory Laboratory Network (RLN) and Sentinel Laboratory Surveillance Results

Laboratory surveillance for influenza and other respiratory viruses involves the use of data from hospital, academic, private and public health laboratories located throughout California. These laboratories report the number of laboratory-confirmed influenza and other respiratory virus detections and isolations on a weekly basis.

The percentage of influenza detections in the RLN and sentinel laboratories in Week 2 (8.4%) decreased compared to Week 1 (10%) (Figure 4). Additional details can be found in Figures 4 and 5 and Table 1.

Neither the RLN nor CDPH-VRDL have identified any influenza viruses by polymerase chain reaction (PCR) typing or subtyping that are suggestive of a novel influenza virus.

2. Antiviral Resistance Testing

Of the influenza specimens tested by the CDPH-VRDL to date this season, no specimens have been found to be resistant to Oseltamivir (Table 2).

3. Influenza Virus Strain Characterization

To date in California, all influenza 2009 A (H1) and A (H3) antigenically characterized viruses have matched the influenza 2009 A (H1) and A (H3) components included in the trivalent and quadrivalent influenza vaccines (Table 3). In addition, all influenza B antigenically characterized viruses in California have matched the influenza B Yamagata lineage virus included in the trivalent and quadrivalent influenza vaccines.

*The Centers for Disease Control and Prevention also performs genetic sequencing of influenza A (H3) viruses. A total of 128 influenza A (H3) viruses were genetically sequenced, and all viruses belonged to genetic groups for which a majority of viruses antigenically characterized were similar to the cell-propagated A/Switzerland/9715293/2013.
† The influenza B Victoria lineage virus is included in only the 2015–2016 quadrivalent influenza vaccine
‡ The influenza B Yamagata lineage virus is included in both the 2015–2016 trivalent and quadrivalent influenza vaccines

C. Laboratory-Confirmed Severe Influenza Case Reports

Currently, as mandated under Section 2500 of the California Code of Regulations, deaths among patients aged 0–64 years with laboratory-confirmed influenza are reportable to CDPH. The weekly influenza report includes confirmed deaths formally reported to CDPH as of January 16, 2016 (Week 2).
During Week 2, there was 1 laboratory-confirmed fatality reported. To date there have been three reports of laboratory-confirmed influenza-associated deaths among patients <65 years of age during the 2015–2016 influenza season.

D. Influenza-Associated Outbreaks

During Week 2, there were two laboratory-confirmed outbreaks reported. To date, six laboratory-confirmed influenza outbreaks have been reported to CDPH for the 2015–2016 season.

E. California Border Region Influenza Surveillance Network Data

The border influenza surveillance network is comprised of outpatient provider sentinel sites whose geographical coverage extends approximately 100 kilometers (60 miles) north of the California-Baja California border and includes Imperial and San Diego Counties, and some parts of Riverside County.

Syndromic Surveillance Update

A total of three border region sentinel providers reported data during Week 2 of 2016, six less than Week 1 of 2016. The total number of patients screened by all sentinel sites for ILI during Week 2 was 313.

Outpatient ILI activity was higher in Week 1 (2.5%) compared to Week 2 (1.9%). ILI activity for the California border region during Week 2 was lower when compared to activity for the same week during the 2014–2015 and 2013-2014 seasons (Figure 6). All influenza syndromic data summarized for the border region represents a subset of CDC influenza sentinel providers in California.

Figure 6. Percentage of Influenza-like Illness Visits Among Patients Seen by California Border Region Sentinel Providers, 2013-2016

Note: The 2016-17 season contains a week 53. Prior years’ data have been shifted so that week 1 aligns across years.
Virologic Surveillance Update

Cumulatively this season, a total of 3,737 respiratory specimens have been tested from border region clinics; of these, 236 (6.3%) tested positive for influenza. Of the 236 specimens that tested positive, 171 (72.5%) were influenza A and 65 (27.5%) were influenza B. Of the 171 specimens that tested positive for influenza A, 22 (12.9%) were subtyped as A(H3), 7 (4.1%) were subtyped as 2009 A(H1), and 142 (83.0%) had no further subtyping performed. For Week 2, a total of 522 respiratory specimens were submitted for testing; 88 (16.9%) were positive for influenza virus. Of the 88 specimens that tested positive, 70 (79.5%) were influenza A and 18 (20.5%) were influenza B. Of the 70 specimens that tested positive for influenza A, 4 (5.7%) were subtyped as A(H3), 4 (5.7%) were subtyped as 2009 A(H1), and 62 (88.6%) had no further subtyping performed. Laboratory data summarized in Figure 7 includes data from influenza sentinel sites as well as laboratory data from other border region laboratories.

Figure 7. Number of Influenza Detections by Type and Subtype Detected in California Border Region Respiratory Laboratory Network and Sentinel Laboratories, 2015-2016
F. Laboratory Update – Other Respiratory Viruses

During Week 2, 4,211 specimens were tested for RSV and 303 (7.2%) were positive, which is lower compared to Week 1 (9.6%) (Figure 8). Information on other respiratory viruses can be found in Figure 9.

Figure 8. Percentage of RSV Detections in Respiratory Laboratory Network and Sentinel Laboratories, 2011–2016
