- **Deaths:** 0 (Age 0-64)
- **Outbreaks:** 1
- **Laboratory:** 6.4% positive
- **Outpatient ILI:** Within expected levels
- **Hospitalizations:** Above expected levels

*Click on images and links for more information*

### Key messages:

- While at low levels, influenza is circulating in California.
- Don’t wait to vaccinate! The flu vaccine can take two weeks to give full protection.
- Protect yourself and your family.
- Anyone over 6 months of age needs a flu shot.
- Stay heart healthy. Flu vaccination helps prevent heart attacks among people with existing heart disease.

**Note:** This report includes data from many sources of influenza surveillance and it should be viewed as a preliminary “snapshot” of influenza activity for each surveillance week. Because data are preliminary, the information may be updated in later reports as additional data are received. These data should not be considered population-based or representative of all California public health jurisdictions.
A. Outpatient and Inpatient Data

1. Influenza Sentinel Providers

Sentinel providers (physicians, nurse practitioners, and physician assistants) situated throughout California report on a weekly basis the number of patients seen with influenza-like illness (ILI) and the total number of patients seen for any reason. ILI is defined as any illness with fever (≥100°F or 37.8°C) AND cough and/or sore throat (in the absence of a known cause other than influenza).

A total of 79 enrolled sentinel providers have reported data for Week 43. Based on available data, the percentage of visits for ILI during Week 43 was 1.7% compared to Week 42 (1.4%) and is within expected levels for this time of year (Figure 1).

Figure 1. Percentage of Influenza-like Illness Visits Among Patients Seen by California Sentinel Providers, 2013–2018

The seasonal baseline was calculated using a regression model applied to data from the previous five years. Two standard deviations above the seasonal baseline is the point at which the observed percentage of ILI is significantly higher than would be expected at that time of year.

2. Kaiser Permanente Hospitalization Data

Inpatients at Kaiser Permanente facilities with an admission diagnosis including the keywords “flu,” “influenza,” “pneumonia,” or variants of the keywords are defined as pneumonia and influenza (P&I)-related admissions. The number of P&I admissions is divided by the total number of hospital admissions occurring in the same time period to estimate the percentage of P&I admissions. Admissions for pregnancy, labor and delivery, birth, and outpatient procedures are excluded from the denominator.

The percentage of hospitalizations for pneumonia and influenza (P&I) in Kaiser
Permanente facilities in northern California during Week 43 was 4.8% compared to Week 42 (3.7%) and is above expected levels for this time of the year (Figure 2).

**Figure 2. Percentage of P&I Hospitalizations in Kaiser Permanente Northern California Hospitals, 2013–2018**

The seasonal baseline was calculated using a regression model applied to data from the previous five years. Two standard deviations above the seasonal baseline is the point at which the observed percentage of pneumonia and influenza hospitalizations in Kaiser Permanente hospitals in northern California is significantly higher than would be expected at that time of year.

3. Influenza-Associated Hospitalizations, California Emerging Infections Program

The California Emerging Infections Program (CEIP), Influenza Surveillance Network (FluSurv-NET) conducts population-based surveillance for laboratory-confirmed influenza-associated hospitalizations among patients of all ages in Alameda, Contra Costa, and San Francisco counties.

The incidence of influenza-associated hospitalizations per 100,000 population was the same in Week 41 (0.08) compared to Week 40 (0.08) (Figure 3). Data for the most current two weeks are not presented because results are still being collected and are likely to change.
Figure 3. Incidence of Influenza Hospitalizations in CEIP Counties, 2015–2018

Note: The 2014-15 season contains a week 53. Data have been shifted so that week 1 aligns across years.

B. Laboratory Update – Influenza

1. Respiratory Laboratory Network (RLN) and Clinical Sentinel Laboratory Surveillance Results

Laboratory surveillance for influenza and other respiratory viruses involves the use of data from clinical sentinel laboratories (hospital, academic, and private laboratories) and public health laboratories in the Respiratory Laboratory Network located throughout California. These laboratories report the number of laboratory-confirmed influenza and other respiratory virus detections and isolations on a weekly basis.

The percentage of influenza detections in clinical sentinel laboratories in Week 43 (6.4%) was higher than Week 42 (3.6%) (Figure 4). The percentage of specimens testing positive for influenza in the Bay Area was >10%, indicating elevated activity. Additional details, including influenza typing and subtyping information from public health laboratories, can be found in Figures 4 and 5 and Tables 1 and 2.

Neither the RLN nor CDPH-VRDL has identified any influenza viruses by polymerase chain reaction (PCR) that are suggestive of a novel influenza virus.
Figure 4. Percentage of Influenza Detections at Clinical Sentinel Laboratories, 2013–2018

Note: The 2014–15 season contains a week 53. Data have been shifted so that week 1 aligns across years.

2. Antiviral Resistance Testing

Of the influenza specimens tested by the CDPH-VRDL to date this season, none have been found to be resistant to Oseltamivir (Table 3).

3. Influenza Virus Strain Characterization

No California specimens have been strain-typed to date during the 2017–2018 influenza season.
C. Laboratory-Confirmed Severe Influenza-associated Case Reports

Currently, as mandated under Section 2500 of the California Code of Regulations, deaths among patients aged 0–64 years with laboratory-confirmed influenza are reportable to CDPH. The weekly influenza report includes confirmed deaths formally reported to CDPH through October 28, 2017 (Week 43).

No laboratory-confirmed influenza-associated fatalities were reported to CDPH since our last report. To date, CDPH has received one report of a laboratory-confirmed influenza-associated death among a patient <65 years of age during the 2017–2018 influenza season.

![Number of Cases vs Week of Symptom Onset](image)

*Earliest date associated with the illness was used for cases without reported date of symptom

D. Influenza-Associated Outbreaks

One laboratory-confirmed influenza outbreak was reported to CDPH since our last report. To date, three laboratory-confirmed influenza outbreaks have been reported to CDPH for the 2017–2018 season.
E. California Border Region Influenza Surveillance Network Data

The border influenza surveillance network is comprised of outpatient provider sentinel sites whose geographical coverage extends approximately 100 kilometers (60 miles) north of the California-Baja California border and includes Imperial and San Diego Counties, as well as some parts of Riverside County.

1. Syndromic Surveillance Update

A total of 15 border region sentinel providers reported data during Week 43. The total number of patients screened by all sentinel provider sites for ILI during Week 43 was 12,665. Outpatient ILI activity was 0.8% in Week 43. ILI activity for the California border region during Week 43 was higher when compared to activity for the same week during the 2015–2016 and the 2016–2017 seasons (Figure 8). All influenza syndromic data summarized for the border region represents a subset of CDC influenza sentinel providers in California.
2. Virologic Surveillance Update

During Week 43, a total of 286 respiratory specimens were tested from border region sentinel clinical laboratories; of these, 15 (5.2%) tested positive for influenza (13 [86.7%] influenza A; 2 [13.3%] influenza B). Cumulatively this season, a total of 1,050 respiratory specimens were tested from border region sentinel clinical laboratories; of these, 45 (4.3%) tested positive for influenza (40 [88.9%] influenza A; 5 [11.1%] influenza B).

No influenza positive specimens were detected at border region RLN laboratories during Week 43. Cumulatively this season, a total of 8 influenza positive specimens have been detected at border region RLN laboratories, of which 8 (100%) were influenza A. Of the 8 specimens that tested positive for influenza A at RLN laboratories, 8 (100%) were subtyped as A (H3).

Laboratory data summarized in Figure 9 include data from border region influenza clinical sentinel laboratories (percentage of specimens testing positive for influenza) as well as data from border region RLN laboratories (influenza type and subtype/lineage type).
Figure 9. Number of Influenza Detections by Type and Subtype Detected in Respiratory Laboratory Network Laboratories and the Percentage of Specimens Testing Positive at Clinical Sentinel Laboratories — California Border Region, 2017–2018

F. Other Respiratory Viruses

1. Laboratory-Confirmed Severe Respiratory Syncytial Virus Case Reports

Currently, as mandated under Section 2500 of the California Code of Regulations, deaths among children aged 0–4 years with laboratory-confirmed respiratory syncytial virus (RSV) are reportable to CDPH. The weekly influenza report includes confirmed deaths formally reported to CDPH through October 28, 2017 (Week 43).

No laboratory-confirmed RSV fatalities were reported to CDPH during Week 43. To date, CDPH has received no reports of laboratory-confirmed RSV-associated deaths among children <5 years of age during the 2017–2018 influenza season.

2. Other Respiratory Virus Laboratory Update

During Week 43, 1,662 specimens were tested for RSV and 14 (0.8%) were positive, which was lower than Week 42 (1.5%) (Figure 10). During Week 43, parainfluenzavirus an coronavirus activity increased, adenovirus and rhinovirus/enterovirus activity decreased, and human metapneumovirus activity remained stable (Figure 11).
Figure 10. Percentage of RSV Detections at Clinical Sentinel Laboratories, 2013–2018

Note: The 2014–15 season contains a week 53. Prior years' data have been shifted so that week 1 aligns across years.

Figure 11. Percentage of Other Respiratory Pathogen Detections at Clinical Sentinel Laboratories, 2017–2018
**Activity Levels:**

**No Activity:** No laboratory-confirmed cases of influenza and no reported increase in the number of cases of ILI.

**Sporadic:** Small numbers of laboratory-confirmed influenza cases or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

**Local:** Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in a single region of the state.

**Regional:** Outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

**Widespread:** Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.

**California Regions:**

**Northern:** Alpine, Amador, Butte, Colusa, Del Norte, El Dorado, Glenn, Humboldt, Lake, Lassen, Mendocino, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Siskiyou, Sutter, Tehama, Trinity, Yolo, and Yuba counties

**Bay Area:** Alameda, Contra Costa, Marin, Napa, Solano, San Francisco, San Mateo, Santa Clara, Santa Cruz, and Sonoma counties

**Central Valley:** Calaveras, Fresno, Inyo, Kings, Mono, Madera, Mariposa, Merced, Monterey, San Benito, San Joaquin, Stanislaus, Tulare, and Tuolumne counties

**Upper Southern:** Kern, Los Angeles, San Luis Obispo, Santa Barbara, and Ventura counties

**Lower Southern:** Imperial, Orange, Riverside, San Bernardino, and San Diego counties

For questions regarding influenza surveillance and reporting in California, please email InfluenzaSurveillance@cdph.ca.gov. This account is monitored daily by several epidemiologists.

To obtain additional information regarding influenza, please visit the CDPH influenza website (https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/Immunization/Influenza.aspx).

A copy of the case report form for reporting any laboratory-confirmed influenza case that was either admitted to the ICU or died can be downloaded from the CDPH influenza website (https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/Immunization/Influenza.aspx).
