California Influenza and Other Respiratory Disease Surveillance for Week 44

(October 30, 2016 to November 5, 2016)

Note: This report includes data from many sources of influenza surveillance and it should be viewed as a preliminary "snapshot" of influenza activity for each surveillance week. Because data are preliminary, the information may be updated in later reports as additional data are received. These data should not be considered population-based or representative of all California public health jurisdictions.

Overall influenza activity in California remained “local*” during Week 44.

**Influenza Report Highlights**

- Influenza activity in California is within expected activity levels for this time of year, but there are some local increases in influenza-like illness activity
- **Outpatient influenza-like illness (ILI)**
  - 1.0% of patient visits during Week 44 were for ILI, which is within expected levels for this time of year
- **Hospitalization data**
  - 3.6% of Kaiser patients hospitalized during Week 44 were admitted with a pneumonia or influenza (P&I) diagnosis, which is within expected levels for this time of year
- **Influenza virus detections by Respiratory Laboratory Network and Sentinel Laboratories**
  - 56 (3.2%) of 1,747 specimens tested were positive for influenza during Week 44
- **Influenza-associated deaths among patients 0–64 years of age**
  - No laboratory-confirmed influenza deaths were reported during Week 44
- **Influenza-associated outbreaks**
  - No laboratory-confirmed influenza outbreak was reported during Week 44

*Local: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in a single region of the state.
A. Outpatient and Inpatient Data

1. Influenza Sentinel Providers

Sentinel providers (physicians, nurse practitioners, and physician assistants) situated throughout California report on a weekly basis the number of patients seen with influenza-like illness (ILI) and the total number of patients seen for any reason. ILI is defined as any illness with fever (≥100°F or 37.8°C) AND cough and/or sore throat (in the absence of a known cause other than influenza).

A total of 75 enrolled sentinel providers have reported data for Week 44. Based on available data, the percentage of visits for ILI during Week 44 was 1.0% compared to Week 43 (1.1%) and was within expected baseline levels for this time of year (Figure 1).

![Figure 1. Percentage of Influenza-like Illness Visits Among Patients Seen by California Sentinel Providers, 2012–2017](image)

2. Kaiser Permanente Hospitalization Data

Inpatients at Kaiser Permanente facilities with an admission diagnosis including the keywords “flu,” “influenza,” “pneumonia,” or variants of the keywords are defined as pneumonia and influenza (P&I)related admissions. The number of P&I admissions is divided by the total number of hospital admissions occurring in the same time period to estimate the percentage of P&I admissions. Admissions for pregnancy, labor and delivery, birth, and outpatient procedures are excluded from the denominator.

The percentage of hospitalizations for pneumonia and influenza (P&I) in Kaiser Permanente facilities in northern California during Week 44 was 3.6% compared to Week 43 (3.7%) and was within expected levels for this time of the year (Figure 2).
3. Influenza-Associated Hospitalizations, California Emerging Infections Program

The California Emerging Infections Program (CEIP), Influenza Surveillance Network (FluSurv-NET) conducts population-based surveillance for laboratory-confirmed influenza-associated hospitalizations among patients of all ages in Alameda, Contra Costa, and San Francisco counties.

CEIP has received 25 reports of laboratory-confirmed influenza-associated hospitalizations through Week 43. The incidence of influenza-associated hospitalizations per 100,000 population decreased in Week 43 (0.17) compared to Week 42 (0.22) (Figure 3). Data for Week 44 are not presented because results are still being collected and are likely to change.
B. Laboratory Update - Influenza

1. Respiratory Laboratory Network (RLN) and Sentinel Laboratory Surveillance Results

Laboratory surveillance for influenza and other respiratory viruses involves the use of data from hospital, academic, private and public health laboratories located throughout California. These laboratories report the number of laboratory-confirmed influenza and other respiratory virus detections and isolations on a weekly basis.

The percentage of influenza detections in the RLN and sentinel laboratories in Week 44 (3.2%) is similar to Week 43 (3.3%) (Figure 3). Additional details can be found in Figures 4 and 5 and Table 1.

Neither the RLN nor CDPH-VRDL have identified any influenza viruses by polymerase chain reaction (PCR) that are suggestive of a novel influenza virus.

2. Antiviral Resistance Testing

Of the influenza specimens tested by the CDPH-VRDL to date this season, no specimens have been found to be resistant to Oseltamivir (Table 2).

3. Influenza Virus Strain Characterization

No California specimens have been strain-typed to date during the 2016–2017 influenza season.

C. Laboratory-Confirmed Severe Influenza Case Reports

Currently, as mandated under Section 2500 of the California Code of Regulations, deaths among patients aged 0–64 years with laboratory-confirmed influenza are
reportable to CDPH. The weekly influenza report includes confirmed deaths formally reported to CDPH as of November 5, 2016 (Week 44).

During Week 44, no laboratory-confirmed influenza fatalities were reported. To date, CDPH has received no reports of laboratory-confirmed influenza-associated deaths among patients <65 years of age during the 2016–2017 influenza season.

**D. Influenza-Associated Outbreaks**

During Week 44, no laboratory-confirmed influenza outbreak reported. To date, three laboratory confirmed influenza outbreaks have been reported to CDPH for the 2016–2017 season.

**E. California Border Region Influenza Surveillance Network Data**

The border influenza surveillance network is comprised of outpatient provider sentinel sites whose geographical coverage extends approximately 100 kilometers (60 miles) north of the California-Baja California border and includes Imperial and San Diego Counties, as well as some parts of Riverside County.

**Syndromic Surveillance Update**

A total of 15 border region sentinel providers reported data during Week 44, compared to 17 during Week 43 of 2016. The total number of patients screened by all sentinel sites for ILI during Week 44 was 13,502.

Outpatient ILI activity was higher in Week 44 (0.7%) compared to Week 43 (0.6%). ILI activity for the California border region during Week 44 was lower when compared to activity for the same week during the 2014–2015 influenza season, but higher when compared to the 2015–2016 season (Figure 6). All influenza syndromic data summarized for the border region represents a subset of CDC influenza sentinel providers in California.
Virologic Surveillance Update

Cumulatively this season, a total of 859 respiratory specimens have been tested from border region clinics; of these, 9 (1.0%) tested positive for influenza. Of the 9 specimens that tested positive, 7 (77.8%) were influenza A and 2 (22.2%) were influenza B. Of the 7 specimens that tested positive for influenza A, 2 (28.6%) were subtyped as 2009 A (H1), 4 (57.1%) were subtyped as A (H3), and 1 (14.3%) had no further subtyping performed. For Week 44, a total of 140 respiratory specimens were submitted for testing; 0 (0.0%) were positive for influenza. Laboratory data summarized in Figure 7 includes data from influenza sentinel sites as well as laboratory data from other border region laboratories.
F. Other Respiratory Viruses

1. Laboratory-Confirmed Severe Respiratory Syncytial Virus Case Reports

Currently, as mandated under Section 2500 of the California Code of Regulations, deaths among children aged 0–4 years with laboratory-confirmed respiratory syncytial virus (RSV) are reportable to CDPH. The weekly influenza report includes confirmed deaths formally reported to CDPH as of November 5, 2016 (Week 44).

During Week 44, no laboratory-confirmed RSV fatalities were reported. To date, CDPH has received no reports of laboratory-confirmed RSV-associated deaths among children <5 years of age during the 2016–2017 influenza season.

2. Laboratory Update

During Week 44, 1,409 specimens were tested for RSV and 50 (3.5%) were positive, which is higher compared to Week 43 (1.4%) (Figure 8). Information on other respiratory viruses can be found in Figure 9.
Figure 8. Percentage of RSV Detections in Respiratory Laboratory Network and Sentinel Laboratories, 2012–2017
