Overall influenza activity in California increased to “widespread*” during Week 51.

**Influenza Report Highlights**

- Influenza activity in California is increasing based on laboratory and outpatient influenza-like illness data
- Outpatient influenza-like illness (ILI)
  - 2.9% of patient visits during Week 51 were for ILI, which is above expected levels for this time of year
- Hospitalization data
  - 5.2% of Kaiser patients hospitalized during Week 51 were admitted with a pneumonia or influenza (P&I) diagnosis, which is within expected levels for this time of year
- Influenza virus detections by Respiratory Laboratory Network and Sentinel Laboratories
  - 808 (20.8%) of 3,886 specimens tested were positive for influenza during Week 51
- Influenza-associated deaths among patients 0–64 years of age
  - No laboratory-confirmed influenza deaths were reported during Week 51
- Influenza-associated outbreaks
  - No laboratory-confirmed influenza outbreaks were reported during Week 51

*Widespread*: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.
A. Outpatient and Inpatient Data

1. Influenza Sentinel Providers

Sentinel providers (physicians, nurse practitioners, and physician assistants) situated throughout California report on a weekly basis the number of patients seen with influenza-like illness (ILI) and the total number of patients seen for any reason. ILI is defined as any illness with fever (≥100°F or 37.8°C) AND cough and/or sore throat (in the absence of a known cause other than influenza).

A total of 47 enrolled sentinel providers have reported data for Week 51. Based on available data, the percentage of visits for ILI during Week 51 was 2.9% compared to Week 50 (2.3%) and exceeded the epidemic threshold level for this time of year (Figure 1).

Figure 1. Percentage of Influenza-like Illness Visits Among Patients Seen by California Sentinel Providers, 2012–2017

2. Kaiser Permanente Hospitalization Data

Inpatients at Kaiser Permanente facilities with an admission diagnosis including the keywords “flu,” “influenza,” “pneumonia,” or variants of the keywords are defined as pneumonia and influenza (P&I)-related admissions. The number of P&I admissions is divided by the total number of hospital admissions occurring in the same time period to estimate the percentage of P&I admissions. Admissions for pregnancy, labor and delivery, birth, and outpatient procedures are excluded from the denominator.

The percentage of hospitalizations for pneumonia and influenza (P&I) in Kaiser Permanente facilities in northern California during Week 51 was 5.2% compared to Week 50 (5.3%) and was within expected levels for this time of the year (Figure 2).
3. Influenza-Associated Hospitalizations, California Emerging Infections Program

The California Emerging Infections Program (CEIP), Influenza Surveillance Network (FluSurv-NET) conducts population-based surveillance for laboratory-confirmed influenza-associated hospitalizations among patients of all ages in Alameda, Contra Costa, and San Francisco counties.

The incidence of influenza-associated hospitalizations per 100,000 population decreased in Week 50 (0.47) compared to Week 49 (1.11) (Figure 3). Data for Week 51 are not presented because results are still being collected and are likely to change.
B. Laboratory Update - Influenza

1. Respiratory Laboratory Network (RLN) and Sentinel Laboratory Surveillance Results

Laboratory surveillance for influenza and other respiratory viruses involves the use of data from hospital, academic, private and public health laboratories located throughout California. These laboratories report the number of laboratory-confirmed influenza and other respiratory virus detections and isolations on a weekly basis.

The percentage of influenza detections in the RLN and sentinel laboratories in Week 51 (20.8%) was higher than Week 50 (13.7%) (Figure 3). Additional details can be found in Figures 4 and 5 and Table 1.

Neither the RLN nor CDPH-VRDL have identified any influenza viruses by polymerase chain reaction (PCR) that are suggestive of a novel influenza virus.

2. Antiviral Resistance Testing

Of the influenza specimens tested by the CDPH-VRDL to date this season, no specimens have been found to be resistant to Oseltamivir (Table 2).

3. Influenza Virus Strain Characterization

To date in California, all influenza 2009 A (H1) and A (H3) antigenically characterized viruses have matched the influenza 2009 A (H1) and A (H3) components included in the trivalent and quadrivalent influenza vaccines (Table 3). In addition, all influenza B antigenically characterized viruses in California have matched the influenza B Yamagata lineage virus included in the quadrivalent influenza vaccine.

†The influenza B Yamagata lineage virus is included in both the 2016–2017 quadrivalent influenza vaccines.

C. Laboratory-Confirmed Severe Influenza Case Reports

Currently, as mandated under Section 2500 of the California Code of Regulations, deaths among patients aged 0–64 years with laboratory-confirmed influenza are reportable to CDPH. The weekly influenza report includes confirmed deaths formally reported to CDPH as of December 24, 2016 (Week 51).

During Week 51, no laboratory-confirmed influenza fatalities were reported. To date, CDPH has received three reports of laboratory-confirmed influenza-associated deaths among patients <65 years of age during the 2016–2017 influenza season.

D. Influenza-Associated Outbreaks

During Week 51, no laboratory-confirmed influenza outbreaks were reported. To date, 14 laboratory confirmed influenza outbreaks have been reported to CDPH for the 2016–2017 season.

E. California Border Region Influenza Surveillance Network Data

The border influenza surveillance network is comprised of outpatient provider sentinel sites whose geographical coverage extends approximately 100 kilometers (60 miles) north of the California-Baja California border and includes Imperial and San Diego Counties, as well as some parts of Riverside County.

Syndromic Surveillance Update

A total of 8 border region sentinel providers reported data during Week 51, compared to 14 during Week 50 of 2016. The total number of patients screened by all sentinel sites
for ILI during Week 51 was 7,533. Outpatient ILI activity was lower in Week 51 (0.9%) compared to Week 50 (1.5%). ILI activity for the California border region during Week 51 was lower when compared to activity for the same week during the 2014–2015 season and the 2015–2016 season (Figure 6). All influenza syndromic data summarized for the border region represents a subset of CDC influenza sentinel providers in California.

Figure 6. Percentage of Influenza-like Illness Visits among Patients Seen by California Border Region Sentinel Providers, 2014–2017

Virologic Surveillance Update

Cumulatively this season, a total of 2,822 respiratory specimens have been tested from border region clinics; of these, 54 (1.9%) tested positive for influenza. Of the 54 specimens that tested positive, 39 (72.2%) were influenza A and 8 (14.8%) were influenza B. Of the 46 specimens that tested positive for influenza A, 3 (6.5%) were subtyped as 2009 A (H1), 23 (50.0%) were subtyped as A (H3), and 20 (43.5%) had no further subtyping performed. None of the specimens that tested positive for influenza B were lineage typed. For Week 51, a total of 312 respiratory specimens were submitted for testing, and 7 (2.2%) tested positive for influenza. Laboratory data summarized in Figure 7 includes data from influenza sentinel sites as well as laboratory data from other border region laboratories.
F. Other Respiratory Viruses

1. Laboratory-Confirmed Severe Respiratory Syncytial Virus Case Reports

Currently, as mandated under Section 2500 of the California Code of Regulations, deaths among children aged 0–4 years with laboratory-confirmed respiratory syncytial virus (RSV) are reportable to CDPH. The weekly influenza report includes confirmed deaths formally reported to CDPH as of December 24, 2016 (Week 51).

During Week 51, no laboratory-confirmed RSV fatalities were reported. To date, CDPH has received one report of a laboratory-confirmed RSV-associated death among children <5 years of age during the 2016–2017 influenza season.

2. Laboratory Update

During Week 51, 3,198 specimens were tested for RSV and 593 (18.5%) were positive, which was higher than Week 50 (14.7%) (Figure 8). Information on other respiratory viruses can be found in Figure 9.
Figure 8. Percentage of RSV Detections in Respiratory Laboratory Network and Sentinel Laboratories, 2012–2017

Note: The 2014–15 season contains a week 53. Prior years’ data have been shifted so that week 1 aligns across years.

Figure 9. Percentage of Other Respiratory Pathogen Detections in Respiratory Laboratory Network and Sentinel Laboratories, 2016–2017
For questions regarding influenza surveillance and reporting in California, please email InfluenzaSurveillance@cdph.ca.gov. This account is monitored daily by several epidemiologists.

For more information regarding the different influenza surveillance data sources, please visit the CDPH Influenza Surveillance Program.

To obtain additional information regarding influenza, please visit the CDPH Influenza Website.

Download a copy of the case report form for reporting any laboratory-confirmed influenza case that was either admitted to the ICU or died.
