Be TB free

1 At Risk?
You can become infected by breathing air that has tuberculosis (TB) germs.
If you have lived in another country or have been around someone who is sick with TB, then you are at risk for being infected with TB germs.
Ask your doctor about getting tested for TB.

2 Get Tested
If the test is positive, go to Step 3
If you do not feel sick, you may still have latent (or “hidden”) TB.
A simple blood test will tell you if you have TB germs in your body.

3 Take Meds
Take the prescribed medicine to protect yourself and your loved ones from getting TB.
Without treatment, you are at risk of developing TB disease, a serious illness that could be spread to your family, friends and community.
