	Continued From page 12 transferred to the ICU. A KUB (kidney, ureters, bladder x-ray) was obtained to rule out a retained foreign body, including a laparotomy sponge. It was read as negative by 2 radiologists. They continued to search for the missing sponge and the operative team had concerns that there was potentially a retained sponge at the end of the procedure. I was notified of this finding late on the afternoon of postoperative day number 1. At that time, the patient was in ICU and was not completely stable. She was requiring transfusion of blood products including fresh frozen plasma for a consumptive coegulopathy (blood clotting disorder) and required massive resuscitation with fluids. Given my concern as well as the ICU attendings, it was not felt that further imaging could be done at that time. After discussion with the radiology department, the plan				This prototype repo
